A SEMINAR ON

Multi-Functional Machine Tool

PRESENTED BY:
Manoj Kumar Poddar
(Manufacturing Engg.)
M.Tech (1ST Sem)
ROLL NO ME093111

UNDER GUIDENCE OF:
Dr. B. Koti Veerachari
NIT Warangal
CONTENTS

- Introduction
- Historical review
- Design principle
- Examples and practical applications
- Key components and supporting technologies
- Assessment
- Conclusions
- References
1. **Introduction**

- The fundamental functions of machine tools are to transform the raw materials with given mechanical properties to the finished parts with required geometry, dimensions and surface quality.
- As the demands are increasing to produce parts with higher quality at reduced cost, the machine tools are required to have higher machining accuracy and speed.
- As the production lot size becomes smaller, a single part with complicated geometry has to be machined without a trial cut.
- In order to meet such requirements, the machine tools are expected to have multiple functions with modular and reconfigurable design architectures.
- The turning centers and machining centers are typical machine tools of such multi-functional machine tools.
POSSIBLE PROCESS INTEGRATION OF MULTI-FUNCTIONAL MACHINES.

2. HISTORICAL REVIEW

2.1. MULTI-FUNCTIONAL TURNING MACHINES

- The boring machine developed by John Wilkinson and the lathe developed by Henry Maudsley
- In order to increase the productivity of the turning machine, the multi-axis automatic turning machine was developed
- These can perform several turning operations simultaneously on one machine equipped with multiple spindles.
- The turret was also developed so that multiple turning operations are possible.
- As simultaneous multi-axis control became possible with the advances in NC technology

EVOLUTION OF PARTS MACHINED BY TURNING MACHINES.
2.2. Multi-functional milling machines

- It was initially mainly used to machine flat surfaces & later expanded to 2D and 3D surfaces.

- The first NC (Numerical controlled) machine tool developed by John T. Parsons in 1952 was a 3-axis milling machine.

- The first MC (Machining center) named Milwaukee-Matic was developed by Kearney and Trecker in 1958.
Milwaukee-Matic Model II developed by Kerney and Trecker in 1958.

THREE POSSIBLE CONFIGURATIONS OF MACHINE STRUCTURE.
POSSIBLE CONFIGURATIONS OF VERTICAL MC.
But the actual structure of the machine is determined by accuracy, rigidity, thermal deformation property and ease of manufacturing.
4. EXAMPLES AND PRACTICAL APPLICATIONS
4.1. MULTI-FUNCTIONAL TURNING MACHINES

- The aerospace, automotive and other mechanical industries as well as machining of dies and molds.

- The turning machine based multi-functional machine tools are mainly used to machine parts, with complicated geometry, efficiently.
 AN EXAMPLE OF HIGH PRODUCTIVITY, HIGH FLEXIBILITY CNC TURNING CENTER.

HEAVY DUTY MULTI-PURPOSE 5-AXIS MILL/TURN MACHINE
4.2. Multi-functional milling machines

- The 5-axis MC is widely used to machine dies and molds.

- 5-axis control is not necessarily used in many cases, but a simultaneous 3-axes control cut with additional off-line 2-axis control for the work posture change is applied.

- The prime advantage of this method is simplicity of the Programming.
ADVANTAGES OF 3 + 2 AXIS CONTROL MACHINING.
COMPARISON BETWEEN 5-AXIS CONTROL AND 3 + 2 AXIS CONTROL.

High speed spindle :-

High speed machining centers are currently equipped with high speed spindles with maximum rotational speeds of 20,000–30,000 /min. Some special machine spindles have a maximum rotational speed up to 100,000 /min.

6. ASSESSMENT OF MULTI-FUNCTIONAL MACHINE TOOLS

- **Evaluation of geometrical and motion accuracy:**
  - In the past, the motion errors of individual axis, such as those of linear motion or rotary motion were measured independently to evaluate the accuracy of a machine tool.
  - Now a well-known double-ball bar technique, proposed by Bryan, has been widely applied to evaluate the motion accuracy of machine tools. This technique calibrate parameter errors like backlash, positioning error, squareness, parallelism, etc.

- **Economical justification:**

7. CONCLUSIONS

- Effort must be devoted to develop a scientific methodology to design new multi-functional machine tools as their demand is still increasing in order to machine complicated and difficult parts at higher speed with higher accuracy.

- The control technology is the key issue to run the multifunctional machine tools effectively and accurately.

- The virtual machine tool technology is expected to play an important role to support advancement of the collision free tool path and simultaneous control of multiple drives.

- CAM software and the supporting technologies, such as NC programming and collision avoidance, are important from the practical point of view, and further efforts are needed to develop these technologies.

- The technology to measure and evaluate the motion error of the multi-functional machine tools. As the number of axes of simultaneous control increases, it becomes extremely difficult to measure the motion error of the machine, especially when the linear and rotary motions are combined. Further research in this field is also needed.
